

# HACKademic

In order to install the OWASP Hackademic Challenges Project to a local hard disk, the Apache web server must have been installed and running, as well as PHP.

## In order to install Apache on Linux (Fedora):

```
[root@hackademic ~]# yum -y install httpd php
```

## To activate the daemon:

```
[root@hackademic ~]# /sbin/service httpd start
```

## To install Apache on Windows (XP/Vista/7):

Download and install XAMPP, which can be found here:

<http://www.apachefriends.org/en/xampp-windows.html>

1) Once PHP has been installed and Apache has been both installed and activated on the machine that will host Hackademic Challenges, download

"OWASP\_Hackademic\_Challenges[EN]\_v0.1" from Google Code:

<https://code.google.com/p/owasp-hackademic-challenges/> and unzip it, preserving the relative paths of the contained files and directories.

2) Copy the appropriate Challenges folder (Hackademic\_Challenges) to either

- /var/www/html/ (for Linux)
- C:\xampp\htdocs\ (for Windows)

3) You can now open a web browser window on the machine you have installed Hackademic Challenges and by requesting the address:

[http://localhost/Hackademic\\_Challenges/](http://localhost/Hackademic_Challenges/)

you should see the welcome page to the Hackademic Challenges :-)

Have fun!

Hackademic Challenges Team
